

This set will cover a variety of weather stripping (windows gaskets) options for passenger car windows. On some more modern cars there is a vertical divider in the middle of the window. The top section of the decal sheet is designed for these windows. You may need to cut these in half for some of the smaller horizontal windows. Some streamlined cars had aluminum frames. Those are on the bottom of the decal sheet. The application is the same for both black and aluminum decals. Be sure the frame bezel is moderately damp before application. If surface is too wet, decal positioning can be problematic. Be sure to work on opposite corners of each window frame. Allow decal to dry completely before applying the second set of corners.
